

## Warranty Commitment – Steel Components

All our steel products manufactured in Önnestad are galvanized. The standard treatment is hot-dip galvanizing, a 150-year-old method in which Smekab Citylife has more than 30 years of in-house experience, ensuring the best possible corrosion protection for our products.

Hot-dip galvanizing is performed by immersing the steel in zinc heated to 460°C, providing strong protection against corrosion. Another advantage of hot-dip galvanizing is that minor damage, such as scratches, is self-healing through ion migration within the affected area.

Powder coating in a wide range of RAL colours can be added on top of the galvanizing, further enhancing the already robust corrosion protection.

We are so confident in the durability of our in-house manufactured steel products that we offer a 50-year warranty against corrosion damage, provided the products have not been subjected to extreme treatment or neglected in terms of maintenance according to our care instructions.

For coated surfaces, we offer a 15-year warranty against flaking, provided the product has not been exposed to mechanical damage or corrosive treatment.

It is completely normal for products to show visual wear over time due to weather, wind, and UV exposure, and for reflectors to require replacement. This is not considered grounds for a warranty claim.
